21	0.70	56.060	tBu
22	0.48	56.062	tBu

Identification of Related Impurities: Automated LC-MS Report

Explanation:

* rel.area = relative area in %; rel.int. = relative intensity in %; corr.area = rel.area * rel.int. in % (rough estimation of rel.area for coeluting impurities)
* "isomer" either indicates isomers of the main compound or the main compound itself (warning: isomer assignments within the tailing or fronting of the main peak can be incorrect - generate an EIC for double check). "no sug." (no suggestion) indicates that the mass difference could not be matched with a known impurity. "n.d." means that no ions were detected in the compound spectrum.
* Truncated sequences are displayed as (bb1:bb2), where bb1 and bb2 are the first and last building blocks in the entered sequence (see above). For oligonucleotides: "o" and "s" symbolize a terminal phosphate and thiophosphates, respectively.
* The product peak usually contains many method-related artefacts. Stay cautious when using the corresponding masses or order a peak purity analysis to be sure.
* Consider the Mass Difference List Excel sheet (I:\Public\R&D Public\LC-MS Tools\Mass Difference List.xlsx) for additional information about mo

Peak Table

peak	RT	RRT	rel.area	M	rel.int.	corr.area	dM	suggestion
1	9.98	0.650	0.15	[redacted]	100	0.15	[redacted]	H-(14:[redacted])
